Input Port	00h	I7	I6	I5	I4	I3	I2	I1	I0

Input Port Register Field Descriptions

Field	Description
I[7:0]	<p>The input port register (register 0) reflects the incoming logic levels of the pins, regardless of whether the pin is defined as an input or an output by the configuration register. It only acts on read operation. Writes to these registers have no effect. The default value, X, is determined by the externally applied logic level.</p> <p>Before a read operation, a write transmission is sent with the command byte to signal the I2C device that the input port register will be accessed next.</p>

Name	Pointer	D7	D6	D5	D4	D3	D2	D1	D0
Output Port	01h	O7	O6	O5	O4	O3	O2	O1	O0

Output Port Register Field Descriptions

Field	Description
-------	-------------

O[7:0]	The output port register (register 1) shows the outgoing logic levels of the pins defined as outputs by the configuration register. Bit values in this register have no effect on pins defined as inputs. In turn, reads from this register reflect the value that is in the flip-flop controlling the output selection, not the actual pin value.
--------	--

Name	Pointer	D7	D6	D5	D4	D3	D2	D1	D0
Polarity Inversion	02h	N7	N6	N5	N4	N3	N2	N1	N0

Polarity Inversion Register Field Descriptions

Field	Description
N[3:0]	The polarity inversion register (register 2) allows polarity inversion of pins defined as inputs by the configuration register. If a bit in this register is set (written with 1), the corresponding port pin's polarity is inverted. If a bit in this register is cleared (written with a 0), the corresponding port pin's original polarity is retained.

Name	Pointer	D7	D6	D5	D4	D3	D2	D1	D0
Configuration	03h	C7	C6	C5	C4	C3	C2	C1	C0

Configuration Register Field Descriptions

Field	Description
C[7:0]	The configuration register (register 3) configures the directions of the I/O pins. If a bit in this register is set to 1, the corresponding port pin is enabled as an input with high impedance output driver. If a bit in this register is cleared to 0, the corresponding port pin is enabled as an output.
